# Topics List

---

- Use of println(), text() in Processing
- Variable Scope
- Compound Assignment Statements

# println() and text() in Processing

---

- To print a message to the console in Processing, use print() or println().
- Both take a String as input, (more later)..for now

```
println("Hello World");
```

```
println("Hello " + "World");
```

```
println("Hell" + "o World");
```

All will produce the same output.

# `println()` and `text()` in Processing

---

- Two strings can be joined together with the plus symbol (+);
- When using this symbol for this purpose it is known as the **concatenation operator**.

# println() contd.

---

- We can introduce variables in the print statement also:

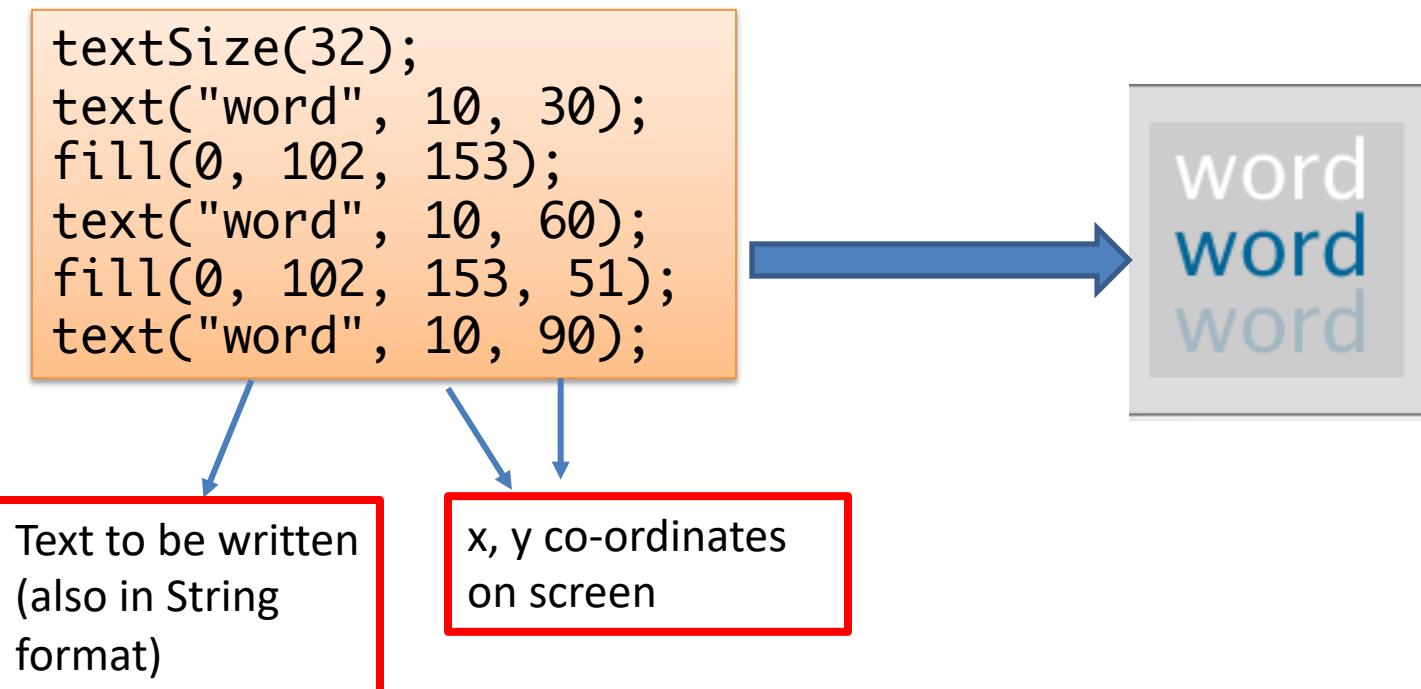

```
int myAge = 20;
```

```
println("I am " + myAge + "years of age");
```

# text() in processing

---

- `text()` can be used to draw text to the screen

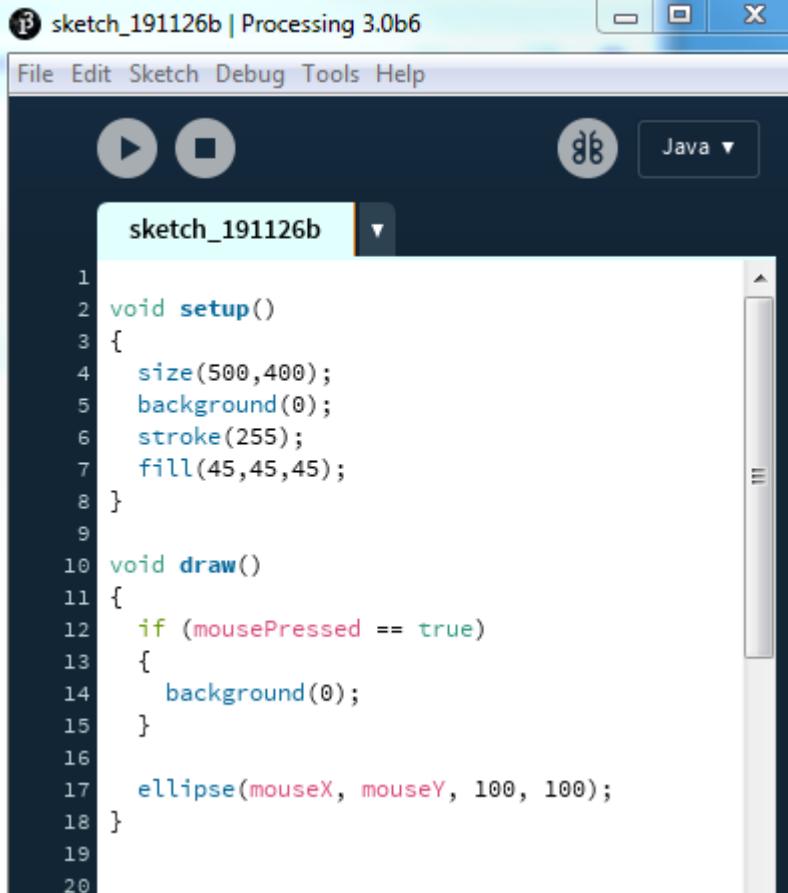

# Topics List

---

- Use of println(), text() in Processing
- Variable Scope
- Compound Assignment Statements

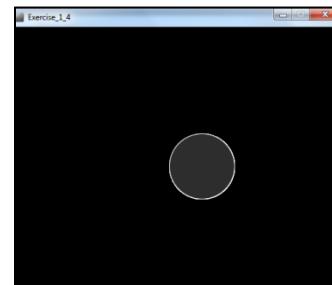

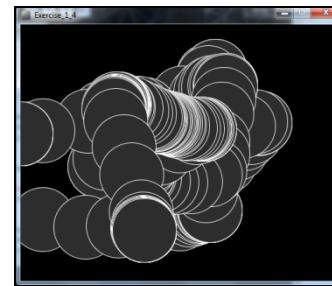

# Recap: Processing Example

```

Java ▾

sketch_191126b

1
2 void setup()
3 {
4     size(500,400);
5     background(0);
6     stroke(255);
7     fill(45,45,45);
8 }
9
10 void draw()
11 {
12     if (mousePressed == true)
13     {
14         background(0);
15     }
16
17     ellipse(mouseX, mouseY, 100, 100);
18 }
19
20
```

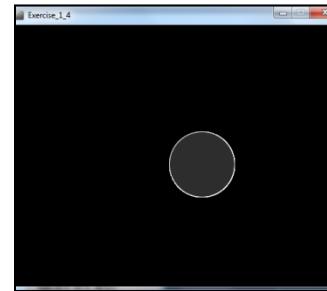

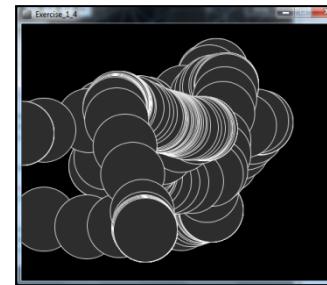

# Variable Scope Example 1

---

The screenshot shows the Processing 3.0b6 IDE interface. The title bar reads "sketch\_191126b | Processing 3.0b6". The menu bar includes File, Edit, Sketch, Debug, Tools, and Help. The sketch window title is "sketch\_191126b". The code editor contains the following Java code:

```
1 void setup()
2 {
3     size(500,400);
4     background(0);
5     stroke(255);
6     fill(45,45,45);
7 }
8
9 void draw()
10 {
11     int diameter = 100;
12
13     if (mousePressed == true)
14     {
15         background(0);
16     }
17
18     ellipse(mouseX, mouseY, diameter, diameter);
19 }
20
21 }
```

# Local Scope – Diameter Variable

---

- The scope of a local variable is the block it is declared in.
- The **diameter** variable is declared in the draw() function i.e. it is a local variable.
- It is only “alive” while the draw() function is running.
- Each time the draw() function:
  - finishes running, the **diameter** variable is destroyed.
  - is called, the **diameter** variable is re-created.

```
void draw() {  
    int diameter = 100;  
    if (mousePressed == true)  
    {  
        background(0);  
    }  
    ellipse(mouseX, mouseY, diameter, diameter);  
}
```

# Local variables – scope rules!

- The **scope** of a local variable is the block it is declared in. A block is delimited by the curly braces {}.
- A program can have many nested blocks.
- A variable must be declared before it is used.

```
int i = int(random(40));           //This gives a random number
                                   //between (and including) 0
                                   // and 39.
```

```
if (i < 10)
```

```
{
```

```
int j = 40;
```

```
println("i is : " + i + " and j is : " + j);
```

```
}
```

```
else if (i >=10)
```

```
{
```

```
int x = 30;
```

```
println("i is : " + i + " and x is : " + 30);
```

```
}
```

Outer block – i is available here

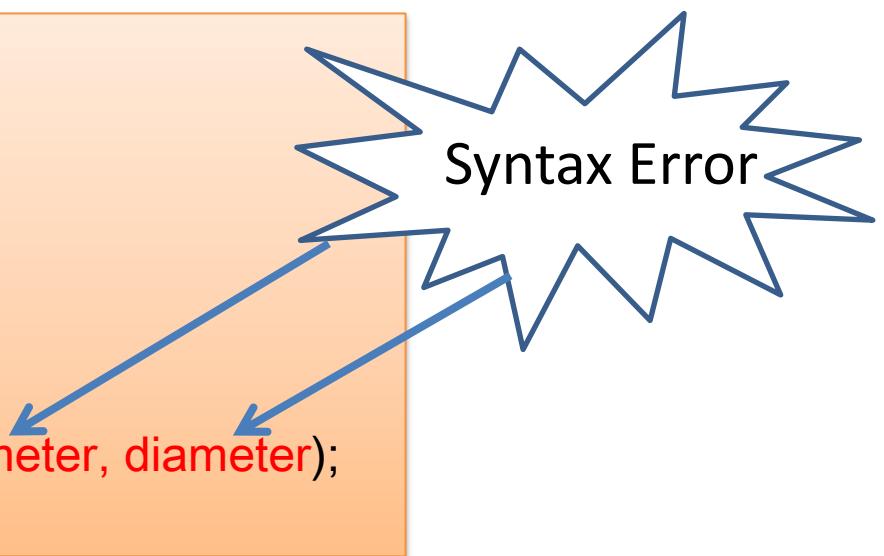

Two inner blocks – i is available in both.

# Local variables – scope rules .. Contd.

---

- The **lifetime** of a local variable is the time of execution of the block it is declared in.
- Trying to access a local variable outside its scope will trigger a syntax error e.g.:

```
void draw()
{
    if (mousePressed == true)
    {
        int diameter = 100;
        background(0);
    }
    ellipse(mouseX, mouseY, diameter, diameter);
}
```

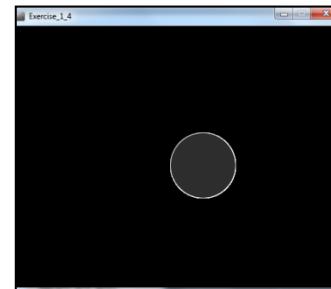

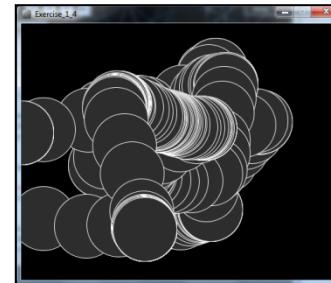

# Variable Scope Example 2

The screenshot shows the Processing 3.0b6 IDE interface. The title bar says "sketch\_191126b | Processing 3.0b6". The menu bar includes File, Edit, Sketch, Debug, Tools, and Help. Below the menu is a toolbar with play and stop buttons. The sketch window title is "sketch\_191126b". The code editor contains the following code:

```
1 void setup()
2 {
3     size(500,400);
4     background(0);
5     stroke(255);
6     fill(45,45,45);
7 }
8
9
10 void draw()
11 {
12     int diameter = 100;
13
14     if (mousePressed == true)
15     {
16         diameter = diameter - 10;
17         background(0);
18     }
19
20     ellipse(mouseX, mouseY, diameter, diameter);
21 }
22 }
```

We now want to reduce the diameter size by 10 each time the mouse is pressed. Q. Is this correct?

# Variable Scope Example 2

---

**We have a bug in our logic.**

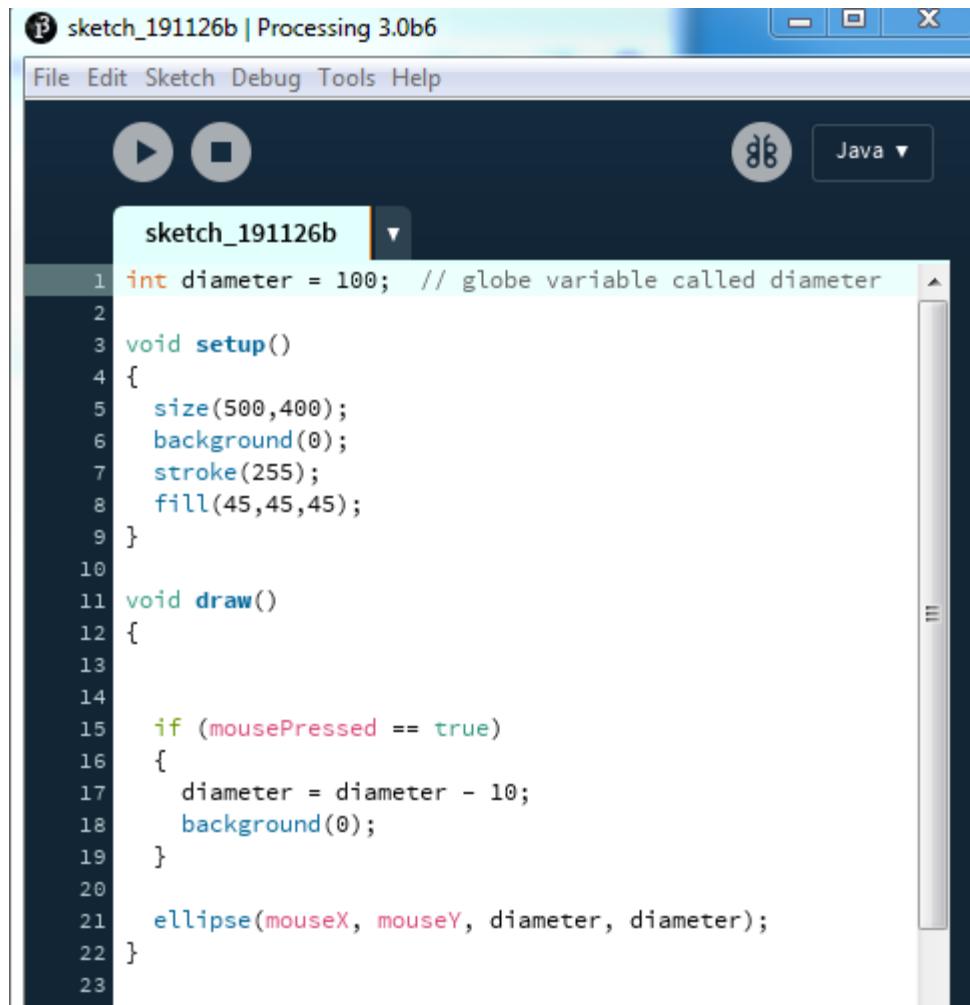

- The diameter variable is re-created each time draw() is called.
- Its value will be set to 100 the first time it is called and then decremented by 10 (to 90).
- However the next time draw executed the variable diameter is re-set back to 100.
- Therefore we will lose our decrement of 10.
- **Solution** – make the local variable a global variable.

# Global Variables – Scope Rules!

---

- The **scope** of the diameter variable is too narrow; as soon as draw() finishes running, the local variable is destroyed and we loose all data.
- We need a diameter variable that lives for the **lifetime** of the sketch i.e. a global variable.

# Variable Scope Example 3

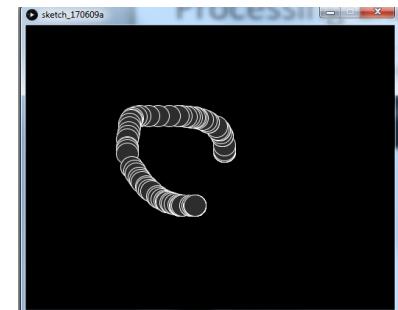

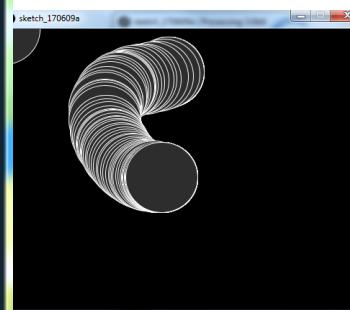

The screenshot shows the Processing 3.0b6 IDE interface. The title bar says "sketch\_191126b | Processing 3.0b6". The menu bar includes File, Edit, Sketch, Debug, Tools, and Help. On the left is a toolbar with play and stop buttons. In the center is the code editor with the following content:

```
1 int diameter = 100; // globe variable called diameter
2
3 void setup()
4 {
5     size(500,400);
6     background(0);
7     stroke(255);
8     fill(45,45,45);
9 }
10
11 void draw()
12 {
13
14     if (mousePressed == true)
15     {
16         diameter = diameter - 10;
17         background(0);
18     }
19
20     ellipse(mouseX, mouseY, diameter, diameter);
21 }
22
23 }
```

The diameter variable is decreased each time we press the mouse.  
Correct!

**However we still have a bug in our logic.**

What happens when we reach zero?

# Variable Scope Example 3b

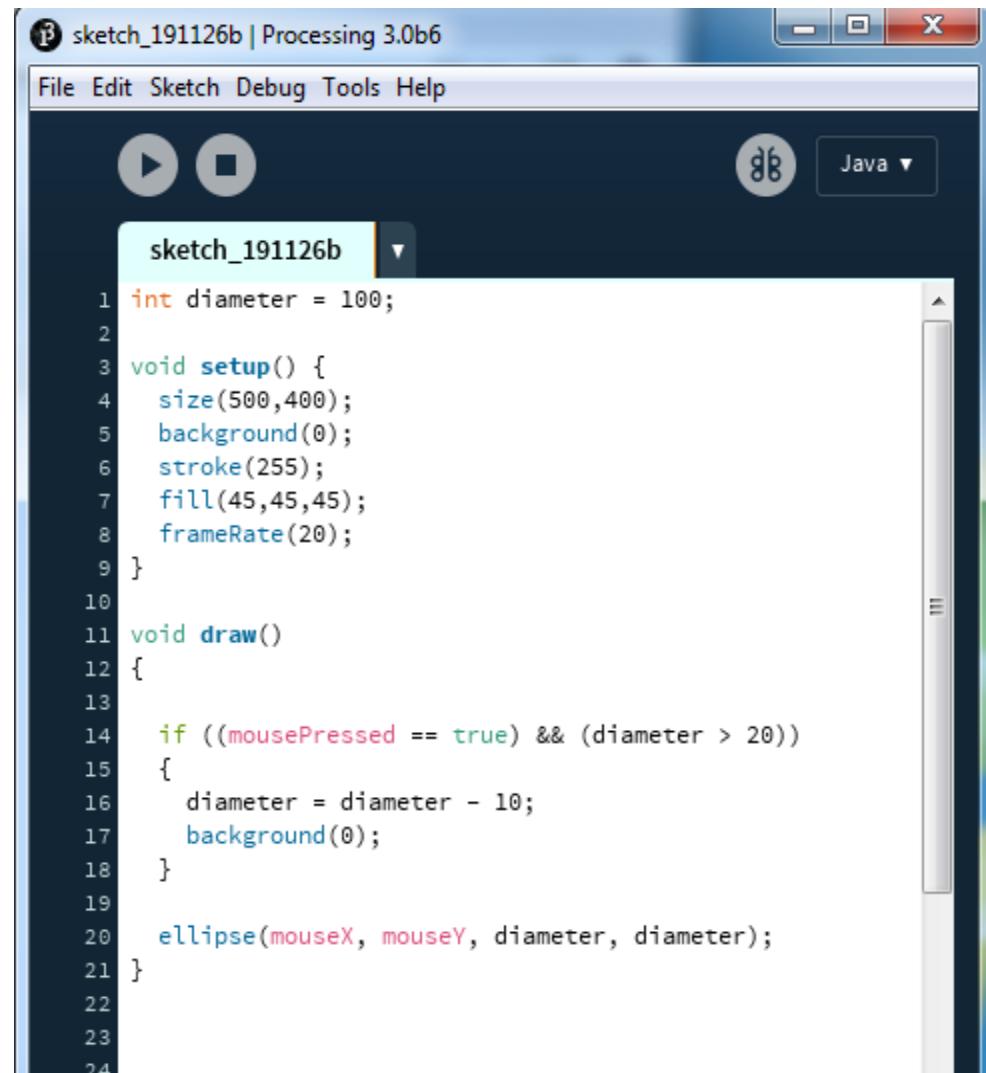

The screenshot shows the Processing 3.0b6 IDE interface. The title bar reads "sketch\_191126b | Processing 3.0b6". The menu bar includes File, Edit, Sketch, Debug, Tools, and Help. Below the menu is a toolbar with play and stop buttons, and a Java dropdown. The main area displays the following Java code:

```
1 int diameter = 100;
2
3 void setup()
4 {
5     size(500,400);
6     background(0);
7     stroke(255);
8     fill(45,45,45);
9 }
10
11 void draw()
12 {
13
14     if ((mousePressed == true) && (diameter > 20))
15     {
16         diameter = diameter - 10;
17         background(0);
18     }
19
20     ellipse(mouseX, mouseY, diameter, diameter);
21 }
22
23 }
```

**In ellipse, the width and height are absolute values (negative sign is dropped).**

To handle this logic bug, we need to stop reducing by 10 when we reach a certain value, say 20.

# Variable Scope Example 3c

```
sketch_191126b | Processing 3.0b6
File Edit Sketch Debug Tools Help
sketch_191126b
int diameter = 100;
void setup() {
size(500,400);
background(0);
stroke(255);
fill(45,45,45);
frameRate(20);
}
void draw()
{
if ((mousePressed == true) && (diameter > 20))
{
diameter = diameter - 10;
background(0);
}
ellipse(mouseX, mouseY, diameter, diameter);
}
```

**Did you notice that it seems the reduction is larger than 10 when we press the mouse?**

Why? The default frame rate is 60 refreshes of the screen per second i.e. draw() is called 60 times per second.

You can change the frame rate by calling the frameRate() function.

# Topics List

---

- Use of println(), text() in Processing
- Variable Scope
- Compound Assignment Statements

# Compound Assignment Statements

---

	Full statement	Shortcut
Mathematical shortcuts	$x = x + a;$	$x += a;$
	$x = x - a;$	$x -= a;$
	$x = x * a;$	$x *= a;$
	$x = x/a;$	$x /= a;$
Increment shortcut	$x = x+1;$	$x++;$
Decrement shortcut	$x = x - 1;$	$x--;$
